 non-perturbative hadronic effects quark-confinement in hadrons (baryons and mesons)

The QCD challenge

physics of interest: weak quark-transition process problem: hidden by QCD effects

- ► large perturbative corrections with strong coupling $\alpha_s(\mu)$ for $\mu \gtrsim m_b$ potentially enhanced by large logs
- non-perturbative hadronic effects quark-confinement in hadrons (baryons and mesons)

basic strategy:

facorise non-perturbative effects into process-independent decay constants and form factors

 \rightarrow to be determined in reference measurements or calculated with non-perturbative methods (lattice QCD, light-cone sum rules, ...)

Separated scales

▶ QCD corrections involve separated mass scales m_1^2 , m_2^2 → logarithmic enhancement $\log(m_1^2/m_2^2)$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Separated scales

- ▶ QCD corrections involve separated mass scales m_1^2 , m_2^2 → logarithmic enhancement $\log(m_1^2/m_2^2)$
- construct sequence of effective theories: decouple heavier particles by encoding their effects into higher dimensional operators

$$\mathcal{L}_{\text{eff}}(q^2 \sim v_{EW}^2) = \mathcal{L}_{SM} + \sum_{d \ge 5} \frac{1}{\Lambda_{NP}^{d-4}} C_n \mathcal{O}_n(\{\psi_{SM}\})$$
$$\mathcal{L}_{\text{eff}}(q^2 \sim m_b^2) = \mathcal{L}_{QCD}^{5f} + \sum_{d \ge 5} \frac{1}{v_{EW}^{d-4}} C_n \mathcal{O}_n(\{\psi_{QCD}^{5f}\})$$
$$\mathcal{L}_{\text{eff}}(q^2 \sim \Lambda_{QCD}^2) = \mathcal{L}_{HQET} + \mathcal{O}(\Lambda_{QCD}/m_b)$$

- finite number of C_i to be fixed from measurements
- \Rightarrow renormalisable and predictive framework

Renormalisability

Renormalisable theory:

Predictions $\widetilde{\mathcal{O}}_i^{(k)}(\mathcal{O}_1^{\exp},\mathcal{O}_2^{\exp})$ in terms of observables $\mathcal{O}_1^{\exp},\mathcal{O}_2^{\exp}$ are UV-finite.

fixed order in effective couplings C_i : (typically first order)

- UV-divergences can be absorbed into C_i to arbitrary order in α_s
- finite number of C_i to be fixed from measurements
- \Rightarrow renormalisable and predictive framework

arbitrary order $k = 1, ..., \infty$ in effective couplings C_i :

- new effective couplings C_i^(k) have to be introduced at each order k to absorb UV-divergences
- infinite number of $C_i^{(k)}$ to be fixed from measurements
- \Rightarrow not renormalisable and not predictive

Phenomenology: fixed order sufficient because higher coefficients are suppressed by higher powers of p_i^2/M_{heavy} and the supersonal set of the set

Renormalisation:

split of bare parameters C_i^0 into a finite part C_i and a counterterm δC_i

$$C_i^0 = C_i + \frac{\delta C_i}{\delta C_i}, \qquad \delta C_i = \frac{\alpha_s}{4\pi} \left(\frac{1}{\epsilon} \zeta_i^{(1)} + \zeta_i^{(2)} \right)$$
